- Predict

# Model specification

```
In [1]: import numpy as np
```

```
In [2]: from keras.layers import Dense
```

```
In [3]: from keras.models import Sequential
```

```
In [4]: predictors = np.loadtxt('predictors_data.csv', delimiter=',')
```

```
In [5]: n_cols = predictors.shape[1]
```

```
In [6]: model = Sequential()
```

```
In [7]: model.add(Dense(100, activation='relu', input_shape = (n_cols,)))
```

```
In [8]: model.add(Dense(100, activation='relu'))
```

```
In [9]: model.add(Dense(1))
```

DEEP LEARNING IN PYTHON

**Let's practice!**

DEEP LEARNING IN PYTHON

# Compiling and fitting a model

# Why you need to compile your model

- Specify the optimizer
  - Many options and mathematically complex
  - “Adam” is usually a good choice
- Loss function
  - “mean\_squared\_error” common for regression

# Compiling a model

```
In [1]: n_cols = predictors.shape[1]
```

```
In [2]: model = Sequential()
```

```
In [3]: model.add(Dense(100, activation='relu', input_shape=(n_cols,)))
```

```
In [4]: model.add(Dense(100, activation='relu'))
```

```
In [5]: model.add(Dense(1))
```

```
In [6]: model.compile(optimizer='adam', loss='mean_squared_error')
```

# What is fitting a model

- Applying backpropagation and gradient descent with your data to update the weights
- Scaling data before fitting can ease optimization

# Fitting a model

```
In [1]: n_cols = predictors.shape[1]
```

```
In [2]: model = Sequential()
```

```
In [3]: model.add(Dense(100, activation='relu', input_shape=(n_cols,)))
```

```
In [4]: model.add(Dense(100, activation='relu'))
```

```
In [5]: model.add(Dense(1))
```

```
In [6]: model.compile(optimizer='adam', loss='mean_squared_error')
```

```
In [7]: model.fit(predictors, target)
```

**Let's practice!**

DEEP LEARNING IN PYTHON

# **Classification models**

# Classification

- ‘categorical\_crossentropy’ loss function
- Similar to log loss: Lower is better
- Add metrics = [‘accuracy’] to compile step for easy-to-understand diagnostics
- Output layer has separate node for each possible outcome, and uses ‘softmax’ activation

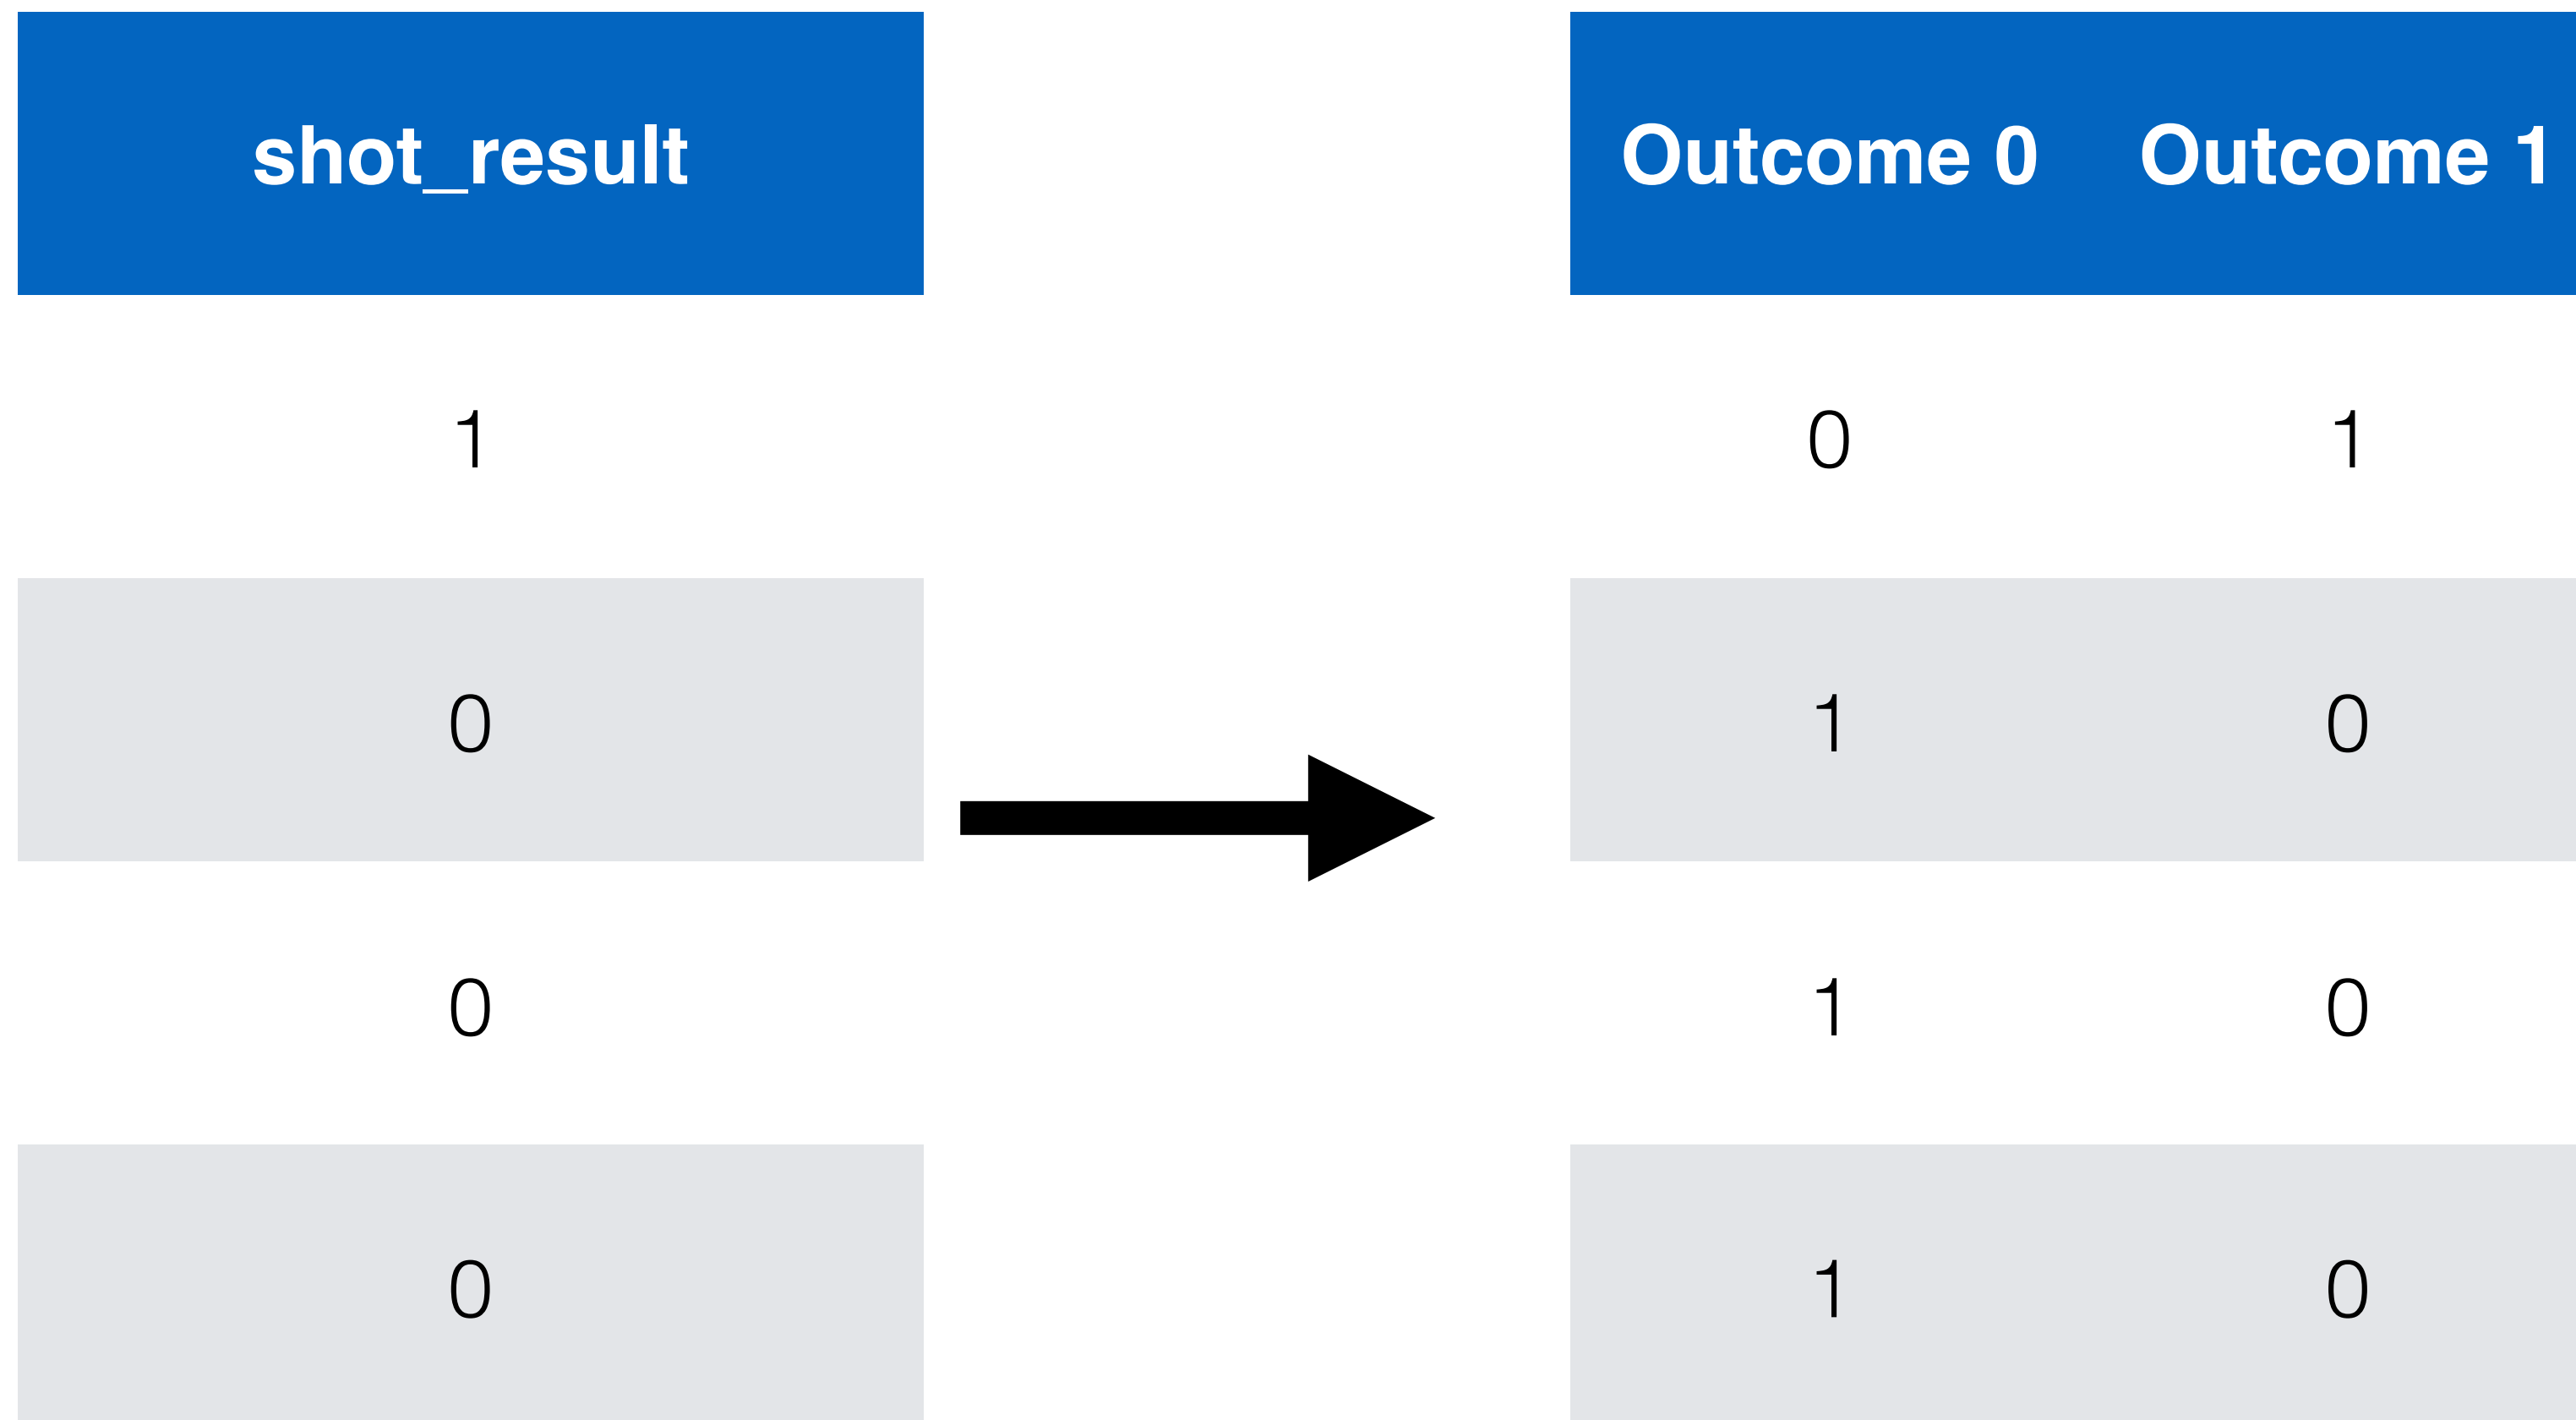

# Quick look at the data

shot_clock	dribbles	touch_time	shot_dis	close_def_ dis	shot_result
10.8	2	1.9	7.7	1.3	1
3.4	0	0.8	28.2	6.1	0
0	3	2.7	10.1	0.9	0
10.3	2	1.9	17.2	3.4	0

# Transforming to categorical

# Classification

```
In[1]: from keras.utils.np_utils import to_categorical

In[2]: data = pd.read_csv('basketball_shot_log.csv')

In[3]: predictors = data.drop(['shot_result'], axis=1).as_matrix()

In[4]: target = to_categorical(data.shot_result)

In[5]: model = Sequential()

In[6]: model.add(Dense(100, activation='relu', input_shape = (n_cols,)))

In[7]: model.add(Dense(100, activation='relu'))

In[8]: model.add(Dense(100, activation='relu'))

In[9]: model.add(Dense(2, activation='softmax'))

In[10]: model.compile(optimizer='adam', loss='categorical_crossentropy',
...:                  metrics=['accuracy'])

In[11]: model.fit(predictors, target)
```
